

24th October 1986,

Dear Steven,

I have now produced a revised draft of the PII paper. The main changes from your version are:

1. I have cut down the discussion of purely philosophical questions to a minimum. They will be dealt with in your own paper.
2. I have calculated explicitly all the relevant 3 particle correlations for a selected paraparticle state, to show violation of PII in its weakest form in this case also.
3. I have been more explicit about what state-dependent properties should be included in the discussion. I suggest, for example, that Q_1, Q_2, Q_3 , although I believe ~~intelligible~~ relevant, are nevertheless not observables! (in accordance with the Messiah-Greubner interpretation of IP.)

If you are happy with the draft I will submit it to B.J.P.B.

In addition I have submitted an abstract of the paper to the 6th International Congress of Logic, Methodology and Philosophy of Science to be held in Moscow in August 1987. This abstract will anyway count as a small publication for you.

I plan to go to Moscow myself, but if you want to come along and present the paper, that would be fine.

With best wishes,

Yours,

Michael Redhead.
